PAMANTASAN NG LUNGSOD NG MAYNILA

(University of the City of Manila)
Intramuros, Manila

I. Objectives

This laboratory activity aims to implement the principles and techniques of image restoration through MATLAB/Octave and open CV using Python

1. Acquire the image.
2. Show Gaussian filter for Image Restoration.
3. Show Deblurring (motion blur removal).

II. Methods

A. Perform a task given in the presentation

- Copy and paste your MATLAB code (use the original picture file: flower.jpg)

```
% Read the image
img = imread('original image'); % Replace with the path to your image file

% Display the original image
figure;
imshow(img);
title('Original Image');

% Convert to grayscale if the image is RGB
if size(img, 3) == 3
    img_gray = rgb2gray(img);
else
    img_gray = img;
end

% Display the grayscale image
figure;
imshow(img_gray);
title('Grayscale');

% Add blur to the image
len = 21;
theta = 11;
psf = fspecial('motion', len, theta);
img_blur = imfilter(img_gray, psf, 'conv', 'circular');
```

PAMANTASAN NG LUNGSOD NG MAYNILA

(University of the City of Manila)
Intramuros, Manila

```
% Show the image
figure;
imshow(img_blur);
title('Motion Blurred Image');

% Filtering Techniques

% Gaussian filtering
h_gaussian = fspecial('gaussian', [5, 5], 1);
img_gaussian_filtered = imfilter(img_blur, h_gaussian);

% Display the Gaussian filtered image
figure;
imshow(img_gaussian_filtered);
title('Filtered Image (Gaussian)');

% Sharpening using unsharp masking
img_sharpened = imsharpen(img_blur);

% Display the sharpened image
figure;
imshow(img_sharpened);
title('Sharpened Image');

% Add Gaussian noise and remove it using median filter
img_noisy = imnoise(img_gray, 'gaussian', 0.02);
img_noisy_removed = medfilt2(img_noisy, [5, 5]);

% Display the noise image
figure;
imshow(img_noisy);
title('Noisy');

% Display the noise-removed images
figure;
imshow(img_noisy_removed);
title('Noise Removed');

% Deblurring

estimated_nsr = 0.01;
img_deblurred = deconvwnr(img_blur, psf, estimated_nsr);
figure;
imshow(img_deblurred);
```

These codes perform the following:

- **Grayscale Conversion:** The code first converts the image to grayscale if it's colored (RGB format). This simplifies the image by removing color information, making it easier for subsequent algorithms to process.
- **Motion Blur:** A motion blur filter is applied, simulating the effect of camera movement during image capture. This can blur sharp edges and details in the original image.
- **Gaussian Filtering:** A Gaussian filter is used to smooth out the image further. This reduces noise introduced by the motion blur but can also blur sharp details remaining from the original image.
- **Sharpening:** Unsharp masking is applied to enhance edges in the image. This counteracts the blurring effect but might introduce some artificial sharpening artifacts.
- **Noise Addition and Removal:** Gaussian noise is artificially added to the grayscale image, simulating imperfections that might occur during image capture. A median filter is then used to remove this noise. Median filters effectively remove impulsive noise but can slightly blur sharp edges.
- **Deblurring:** Finally, an attempt is made to reverse the motion blur using deconvolution. This process aims to recover the original sharp image, but its effectiveness depends on the accuracy of the estimated blur parameters and the amount of noise present.

2. Visualize the results, analyze and interpret:

The first action in the course of any picture processing process is the act of getting the picture from a file. This is an indispensable procedure as it is the basis of other operations. In OpenCV Python, the `cv2.imread` function is used to bring in an image from a specified file path, which admits different image types. This function, in turn, brings the image into memory for more handling. Likewise, in MATLAB, the `imread` function allows users to do this by merely selecting images from different types of formats. Octave does not differ in this respect as it uses its own `imread` function to load the image file in the program and then proceeds to the next step where it is to be pre-processed. The main thing to be achieved at the time of image acquisition is that the image data is the one available for the next analysis and enhancement.

As a matter of fact, Gaussian filtering is an important image restoration technique in which the image is smoothed, thus taking away the noise and improving the overall disposition of the image. In OpenCV Python, this is done via the use of the `cv2.GaussianBlur` function to apply a Gaussian filter to the picture. Smoothing can be regulated by changing the kernel size and standard deviation, variables typically set to (5, 5) and 1, respectively. The function `fspecial` of MATLAB is brought into play by computing a Gaussian filter. Once the resultant filter is created, the `imfilter` function applies it to the picture. Users can adjust the standard deviation and kernel size to get the noise and smoother image. Octave virtually follows the same procedure as MATLAB, where `fspecial` is used for the design of the Gaussian filter and `imfilter` is used for its application. A very clear and noise-reduced image appears as the final solution which is the proof of its powerful effect that the Gaussian blurring has on image restoration.

Deblurring is a process for eliminating the blur caused by moving objects during imaging, a problem which often arises in photography. The main purpose of this method is to restore the quality of the original image and remove the blur artifacts. In OpenCV Python, deblurring can be performed by using the `cv2.filter2D` function along with a specially developed kernel or by Wiener filtering under `scipy.signal.convolve2d`. MATLAB offers efficient tools through the `deconvwnr` function that performs Wiener filtering to estimate and correct motion blurs it requires knowledge of the point spread function PSF and the amount of noise-to-signal ratio(NSR) the image has. Likewise, Octave is equipped with a tool to eliminate motion blur using the `deconvwnr` function that applies the Wiener

PAMANTASAN NG LUNGSOD NG MAYNILA

(University of the City of Manila)

Intramuros, Manila

filter, thus successfully achieving the results. Both have a wide range of motion and deblurring tools that are tailored towards correcting motion blur and restoring the image to its best quality. Each platform has developed its blurring removal facilities where some customized tools and methods for developers and users to solve the problem of blurring and restoration of image quality.

Every one of the procedures corresponds to various objectives for imaging such as restoration, enhancing, and collecting, which showcases the variety of capabilities these skills give to picture processing instruments.

IV. Conclusion

In this laboratory activity, we successfully demonstrated a comprehensive approach to image processing using OpenCV Python, MATLAB, and Octave. The primary objectives were to acquire an image, apply Gaussian filtering for image restoration, and perform deblurring to correct motion blur.

The laboratory activity highlighted the effectiveness of image processing techniques in improving image quality. By acquiring, restoring, and enhancing images through Gaussian filtering and deblurring, we demonstrated how these methods can significantly impact the clarity and usability of digital images. The successful application of these techniques across OpenCV Python, MATLAB, and Octave underscores the versatility and power of modern image processing tools in achieving high-quality results.
